CLAIM OR CLAIMS

WHAT IS CLAIMED IS:

5

10

15

20

1. A method of detecting a frequency correction burst signal in a received signal comprising the steps of:

delaying the received signal by a period that is an integer multiple of one cycle of rotation of the frequency correction burst signal to produce a reference signal; and

correlating the received signal with a conjugate version of the reference signal to produce a correlation result that is insensitive to a frequency offset in a nominal carrier frequency of the received signal, the correlation result being indicative of a location of the frequency correction burst signal within the received signal.

- 2. The method as recited in claim 1 further comprising the step of estimating the frequency offset as a function of the correlation result.
 - 3. The method as recited in claim 1 wherein the correlating step uses only real components of the received signal for improved computational efficiency where the frequency offset is expected to be within an acceptable range around nominal.
 - 4. The method as recited in claim 3 further comprising the steps of: determining quadrature components of the received signal at the

location of the frequency correction burst signal to determine in conjunction with the real components a phase angle; and

estimating the frequency offset as a function of the phase angle.

- 5. The method as recited in claim 1 further comprising the step of down-converting the received signal to a baseband complex discrete-time sample signal for input to the delaying and correlating steps as the received signal.
 - 6. The method as recited in claim 5 wherein the down-converting step comprises the steps of:

10

15

mixing the received signal with a first local oscillator signal to produce an intermediate frequency signal;

digitizing the intermediate frequency signal to produce a sampled intermediate frequency signal;

mixing the sampled intermediate frequency signal with a second complex local oscillator signal to produce a sample signal with real and quadrature components as the baseband complex discrete-time sample signal.
